Contents

- 1. Introduction
- 2. Maude
- 3. BIKE
- 4. Experiments
- 5. Conclusions

- Threat of quantum computers
 - Shor's algorithm
 - Grover's algorithm

- Solution by the NIST with the Post-Quantum Cryptography project
 - o Round 4 (2022): BIKE, Classic McEliece, HQC, SIKE

Introduction 3 of 10

Types of security analysis

- Computational
 - Mathematical proofs and probabilities
 - Keys, messages,... are bit strings
 - Closer to reality, used by cryptographers

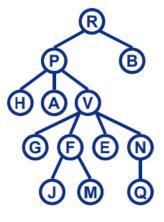

- Symbolic
 - Cryptographic primitives as black boxes
 - Keys, messages,... are symbols
 - Suitable for automation and easier to understand for non-experts of cryptography

Introduction 4 of 10

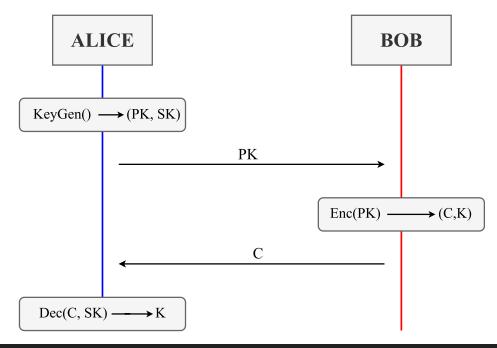

E3buoM

- Maude is a modelling, programming and verification language
- Explicit state model checking using search or LTL properties
- Origins at Stanford, California
- Project members
 - USA
 - Norway
 - Spain

Discovery of Man-In-The-Middle

Discovered key vulnerability

Experiments

- Symbolic specification of BIKE using a formal framework
- Extended symbolic analysis
 - Verify its correctness with respect to the original protocol specification
 - Check three properties in Maude's LTL Model Checker
 - Key Sharing (LIVENESS)
 - FAIRNESS
 - SECURITY
- Found a MITM attack and a design vulnerability
 - Both can be fixed using authentication or integrity over messages
 - Design vulnerability can be avoided by checking insecure/weak keys before Enc
